

Central Square NY – Dale Caswell, recently announced that Ameritool Manufacturing has yet again added to its already extensive product line by now offer adjustable force tension springs.

Caswell, commenting on this new product line, said, "We are always striving to offer our customers innovative products while continuing to hold our outstanding quality. This is a another great addition to what we already offer"

Constructed from 316 stainless steel, Ameritool adjustable tension springs are used on doors, lids, hatches, hoods and any other apparatus that must be pulled open or pulled shut.

Adjustable tension springs work by the force pulling the rod inward, operating in the opposite direction of standard gas springs and the adjustability allows the end user to adjust the force of the unit to work with their requirements. It is very user friendly with no tools required to adjust.

Please contact Ameritool to discuss your specific requirements. In order to ensure that the correct model spring is selected. Ameritool offers free design application services for all gas spring applications. Please refer to the gas spring specification worksheet.

Since 1993, Ameritool Mfg, the first and the largest North American manufacturer of 100% American-made, high-quality 316 stainless-steel gas springs, dampers and tension gas springs, offers exceptional product quality, innovative design solutions, quick delivery and complete customer service.

Boat builders, aerospace, industrial, food service and farm-equipment manufacturers worldwide use Ameritool products as original parts in their product lines.
